## Populus tremuloides: We Are One

## S. J. Kariko

Watch the deer's ears—
are they both towards you?
Is one angled back? Look around,
see what she's listening to,
they can sense things.

Learn to read the ears of the deer.

Listen for when birds stop calling, when songs change, calls shriek out, shrill across the sky.

Look where trees are torn up,
ant mounds clawed apart,
no guarantee our team will stay safe,
so look to the ones we can learn from—
watch the deer's ears.

After the nurse was found partially eaten and cached, to be finished later by the mother bear, and at least one, if not both of her cubs,

we listen on cobbled banks, our bodies electric seeing fresh tracks

we spring at the ping of a pebble falling on the shore.

Now, mountains disappeared for more than a week, smoke slows me down 'til I end up at the clinic seeking relief—
more steroid inhalers to bring breath back in.

from wildfires two to three states away, ponderosa and fir, cedar and spruce,

beetle-killed, sap-filled—exploding

across highways even lakes.

This smoke—

This smoke—

of young firefighters

perished in these blazes,

whose ash and spirit is mixed

with lodgepole and owl and ground

squirrel and telephone poles and their vehicles—

all traveling cross our country now

to where I sit, here, in this aspen grove.

Aspen, they are one.

Standing together, a single organism,

sharing ancient roots, some 80,000 years strong.

Aspen come back first. Need

fire to compete with conifers.

Their green-white bark blackens around where branches sprout out, deer rub velvet off, elk incise toothy lines and young cubs climb.

These storied trunks reach all at once into thick sky, fingerling branches entwined under a now orange moon, leaves hanging on edge, ready to move at the slightest...

They dance—

whirling together,
on long flattened petioles,
such delicate attachments,

Populus tremuloides.

Standing just below leaf and wind, story and sky, we listen for the deer's ears from now—until when?

At the clinic, they tell us that even if we begin driving east today

we'll still have two days through smoke.

I try to imagine this: our country

blanketed—while grizzly cubs are driven to a zoo, to be fed by humans, for the rest of their lives.

Populace tremuloides

Inspired by events while conducting field research in the living laboratory of what is currently called the Greater Yellowstone Ecosystem. Written with a tender heart for the nurse, the bears, the firefighters, and all of their loved ones; and in celebration of Pando—possibly the oldest living stand of aspen trees on our planet.
